

LA BLANCHE LIQUIDE

It is important to be able to regulate the climate in a greenhouse. The most important factors in this small biosphere are light, temperature and the relative humidity.

La Blanche Liquide is a shading compound that enables the user to regulate his climate on a cheap way.

La Blanche Liquide is always used on the outside of the greenhouse or plastic tunnel. The amount of water added to La Blanche Liquide is of influence on the light intensity and temperature in the greenhouse.

La Blanche Liquide is a product that doesn't rain of from a greenhouse.

La Blanche Liquide will become more clear when it is wet. When La Blanche Liquide is dry it will be white again. So when it is dark and rainy more light will enter the greenhouse, but when the sun is shining during the summer La Blanche Liquide will become white and reflect most of the sunlight. There is also the possibility to spray the coating wet to get more light into the greenhouse during dry days.

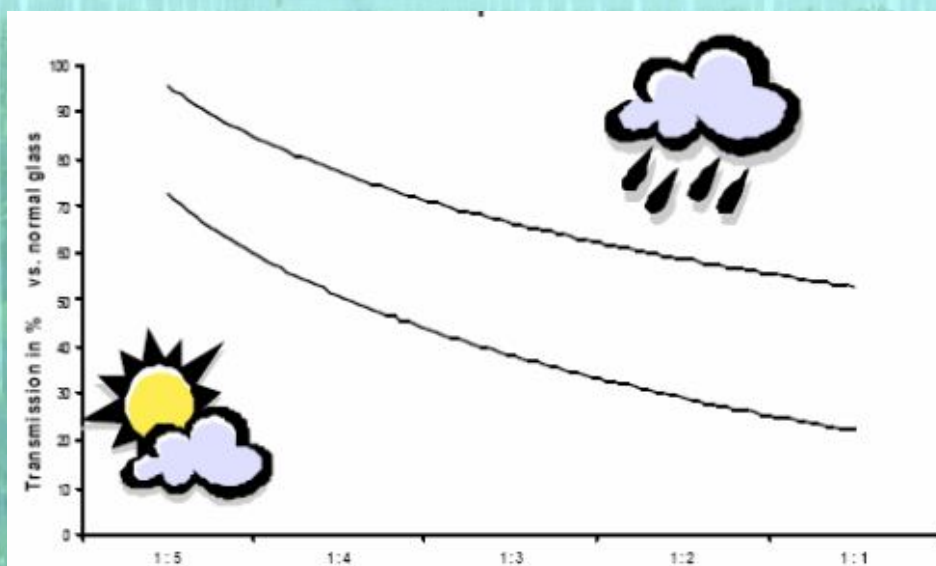

La Blanche Liquide has the ability to stay on the greenhouse the entire season. We talk about a season from March/April till August/September. The shading period depends on the thinning-rate applied.

Thinning-rate vs Shading period	
1 kg La Blanche Liquide with 1 litre water	12 months
1 kg La Blanche Liquide with 1,5 litre water	9 months
1 kg La Blanche Liquide with 2 litre water	6 months
1 kg La Blanche Liquide with 4 litre water	2-3 months

Transmission in % vs. Normal glass in wet and dry situation.

For removing La Blanche Liquide on greenhouses we advice to use a brush on a wet La Blanche Liquide-film.

Thinning rate La Blanche Liquide

Packaging unit
